Derwent Abstract: (JP62243634A) Method comprises crosslinking copolymer prep. by copolymerising ethylene and diene cpd(s). in mol ratio of diene cpd(s)/ethylene of at least 0.5 in the presence of catalyst system comprising solid catalyst contg. Mg and Ti and/or V and an organometallic cpd. in mol. ratio of Ti and/or V/diene cpd. of at least 1.0 x 10 power -5 and having intrinsic viscosity of at least 5 dl/g as measured at 135 deg.C in decalin and crosslinking the copolymer in the presence of organic peroxide or by irradiating radiation beams. Pref. the diene cpd. is non-conjugated polycyclic diene (e.g. 5-vinyl-2-norbornene, 5-ethyl-2-norbornene, dicyclo-pentadiene, norbornadiene or propenyl norbornene), non-conjugated aliphatic diene (e.g. 1,4-pentadiene, 1,4- or 1,5-hexadiene, etc.) or conjugated aliphatic diene (e.g. 1,3-butadiene, isoprene, etc.). The copolymerisation is at 0-90 deg.C and 0-70 kg/cm²G in gas phase or in an inert solvent.
USE/Advantage - The crosslinked copolyethylene has mol.wt. of at least 1,000,000 and high resistance to heat, solvents and abrasion and high dimensional stability and self-lubrication. It is used as a material for mfg. hopper, silo, gear, etc. or as a lining or backing material in various industrial fields.
